

DORMANCY

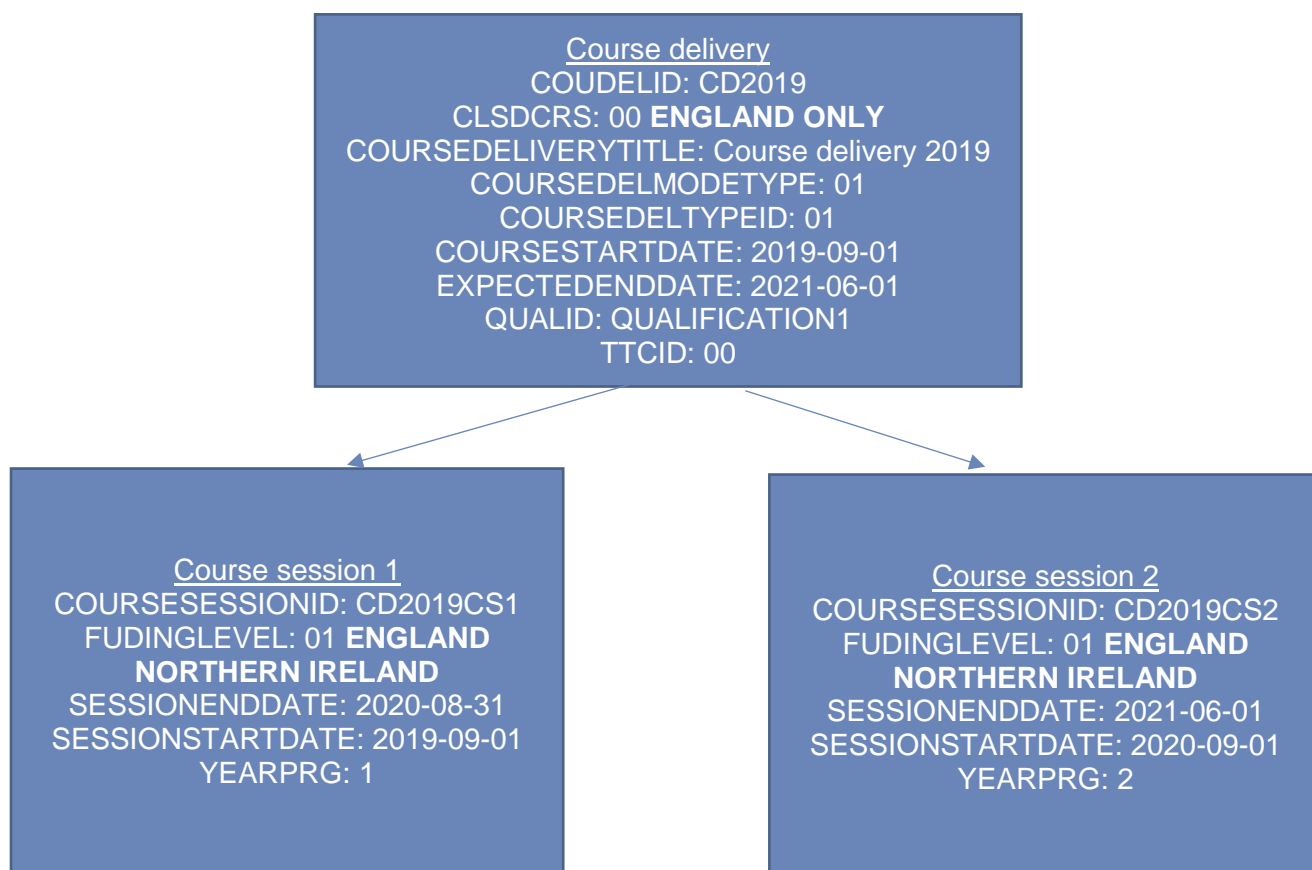

This document runs through four scenarios of students taking a break in learning under different circumstances.

The first pages of this document show the curriculum data that these example students are interacting with.

CURRICULUM DATA

Course delivery 1

A provider offers a two-year Course delivery starting in September 2019 with the following characteristics:

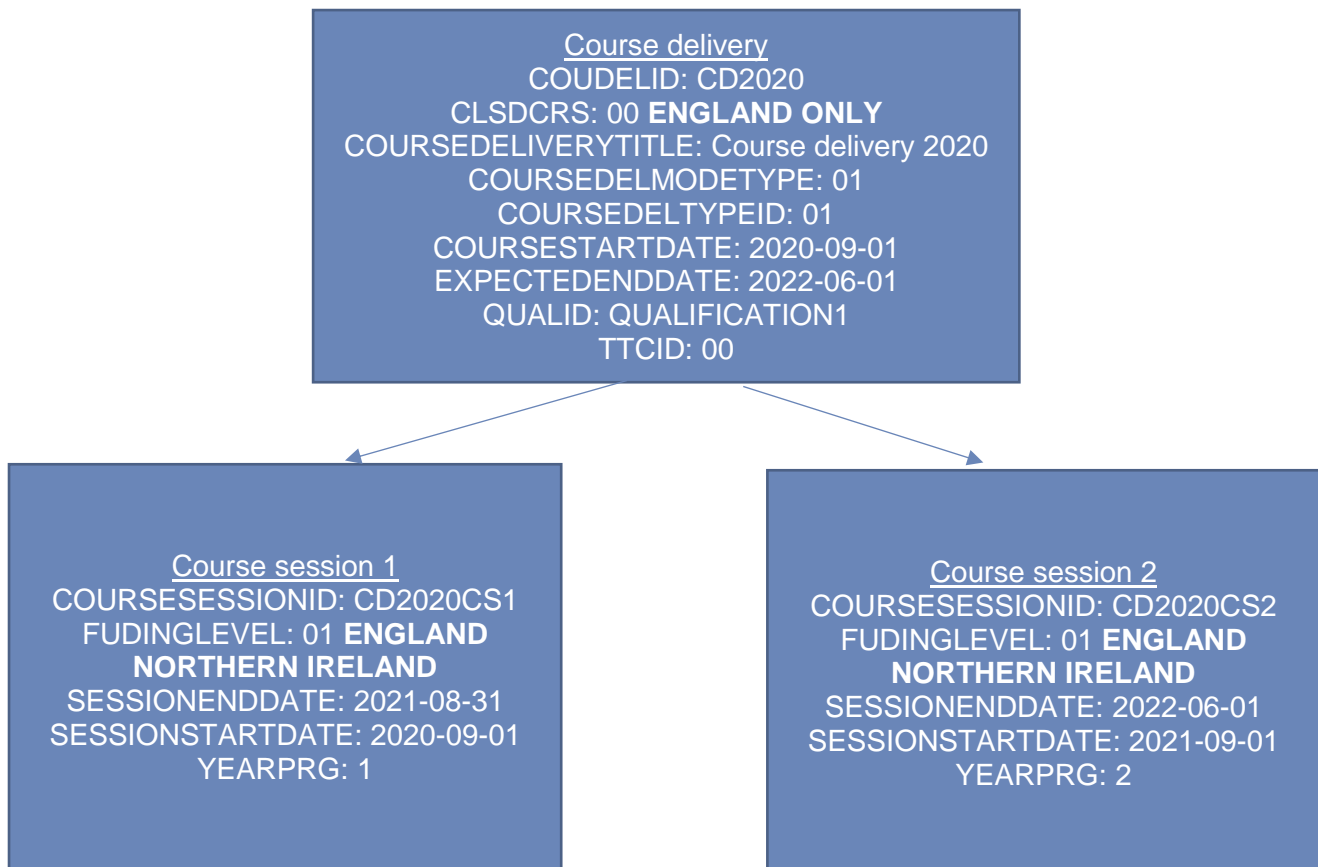

The Course delivery runs for two years and so has two Course sessions, each representing a year of the Course delivery. The first has a year of programme (YEARPRG) of 1 and the second having a year of programme of 2.

A Student course session would be returned for each student engaging with a Course session. The Course session identifiers (COURSESESSIONIDs) will need to be returned for each Student course session showing a student's engagement with that Course session.

ID for Course session 1: CD2019CS1
ID for Course session 2: CD2019CS2

Course delivery 2

The provider runs the same Course delivery over multiple years and so has another Course delivery running in the following year. This Course delivery is identical to the previous delivery with the exception of the dates being a year later. The COUDELID must also be different to Course delivery 1 as this must be a unique identifier for the Course delivery.

A Student course session would be returned for each student engaging with a Course session. The Course session identifiers (COURSESESSIONIDs) will need to be returned for each Student course session showing a student's engagement with that Course session.

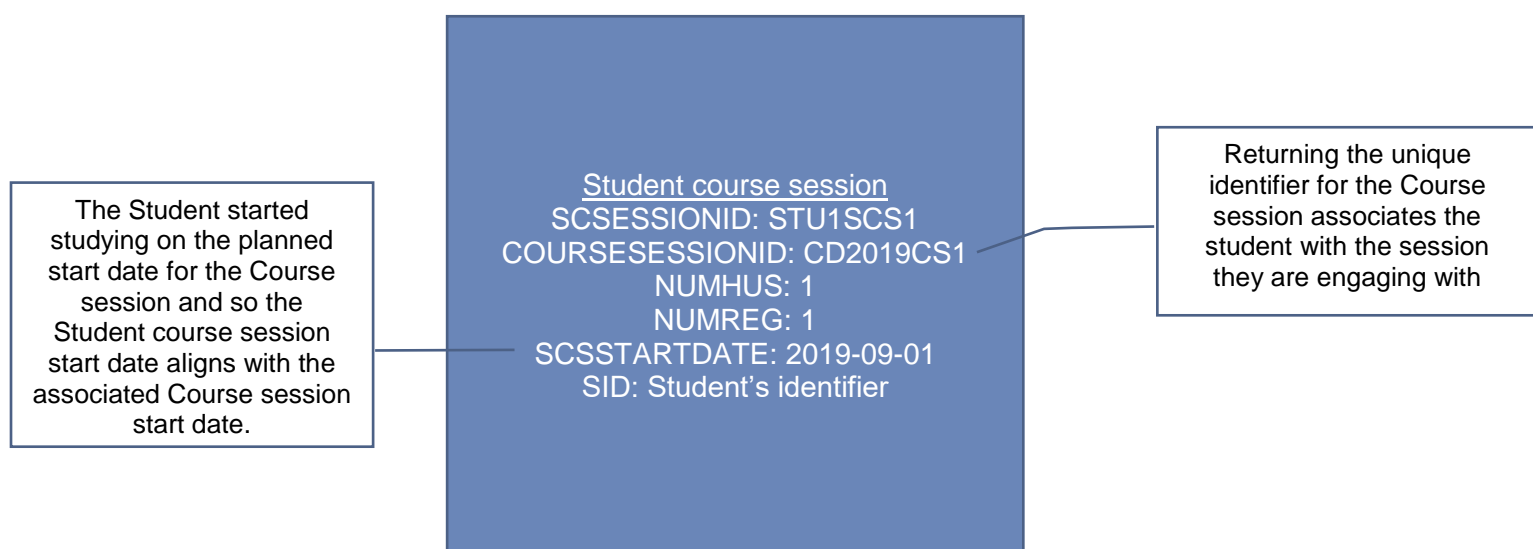

ID for Course session 1: CD2020CS1
ID for Course session 2: CD2020CS2

STUDENT DATA

Student 1: Student goes dormant part way through the Course session

Student 1 begins studying on Course delivery 1.

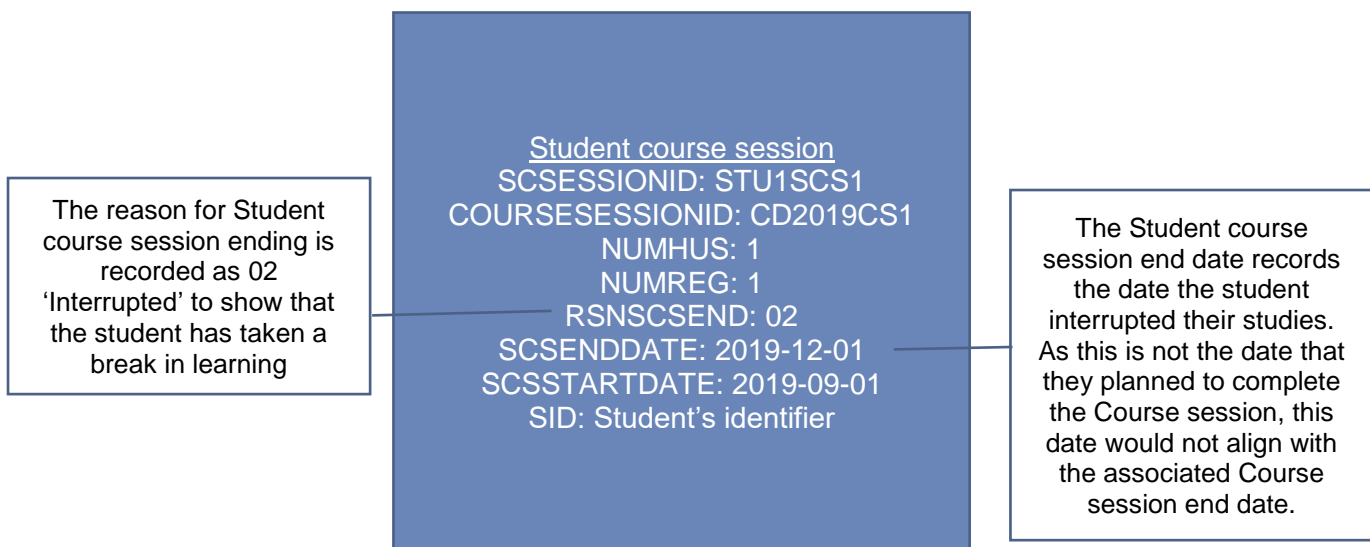

When the student begins studying, they would be associated with the first Course session of Course delivery 1 with the return of a Student course session.

Student 1: Student goes dormant part way through the Course session

Part way through the first year the student agrees with the provider to take a break in learning. The provider knows that the student will not be returning to study before the end of the associated Course session.

The Student course session is ended with a date and reason for ending because the provider knows that the Student course session will not become active again.

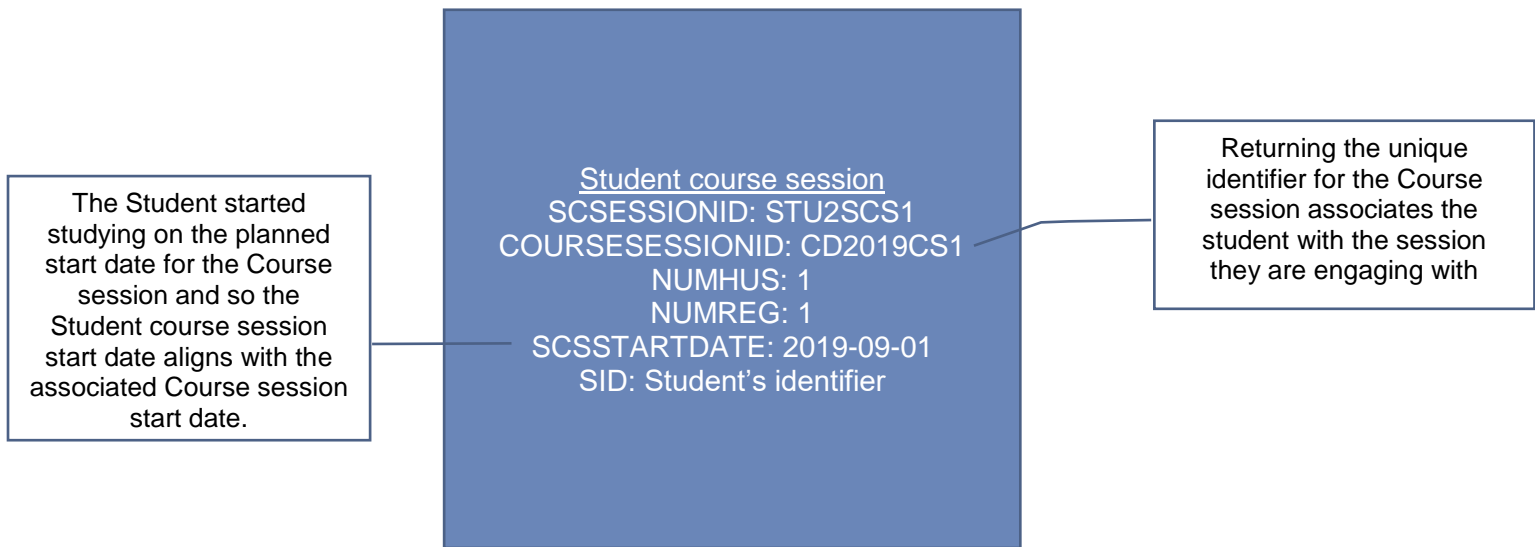

As the reason for Student course session ending has been recorded as 02 'Interrupted', this student does not need to be returned again until they restart study, or they will no longer be returning to study.

Student 2: Student goes dormant and restarts study within the same Course session

Student 2 begins studying on Course delivery 1.

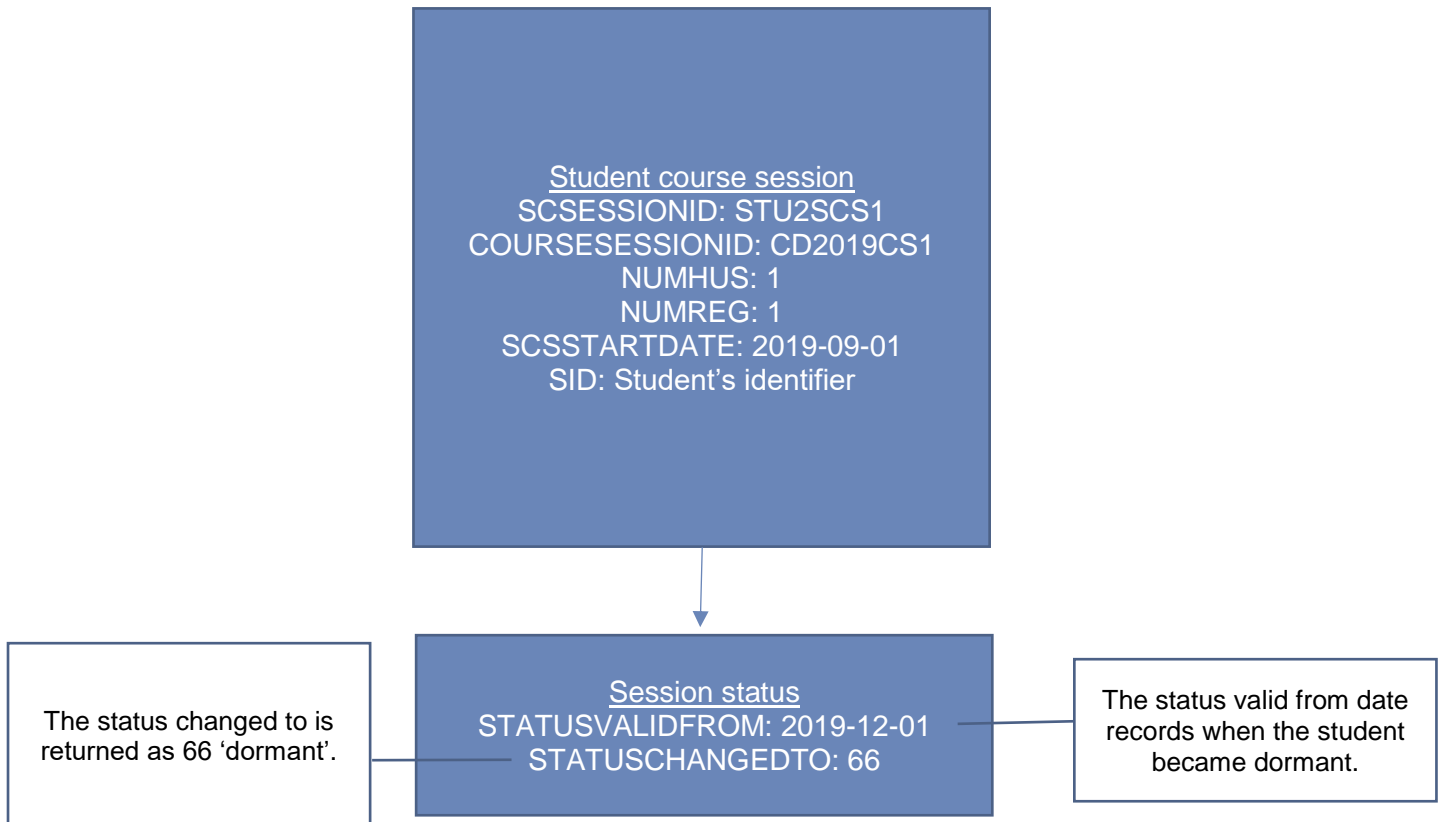

When the student begins studying, they would be associated with the first Course session of Course delivery 1 with the return of a Student course session.

Student 2: Student goes dormant and restarts study within the same Course session

Part way through the first year the student agrees with the provider to take a break in learning. The provider does not know when the student will return to study.

A Session status entity is returned to record that the student is now not actively studying.

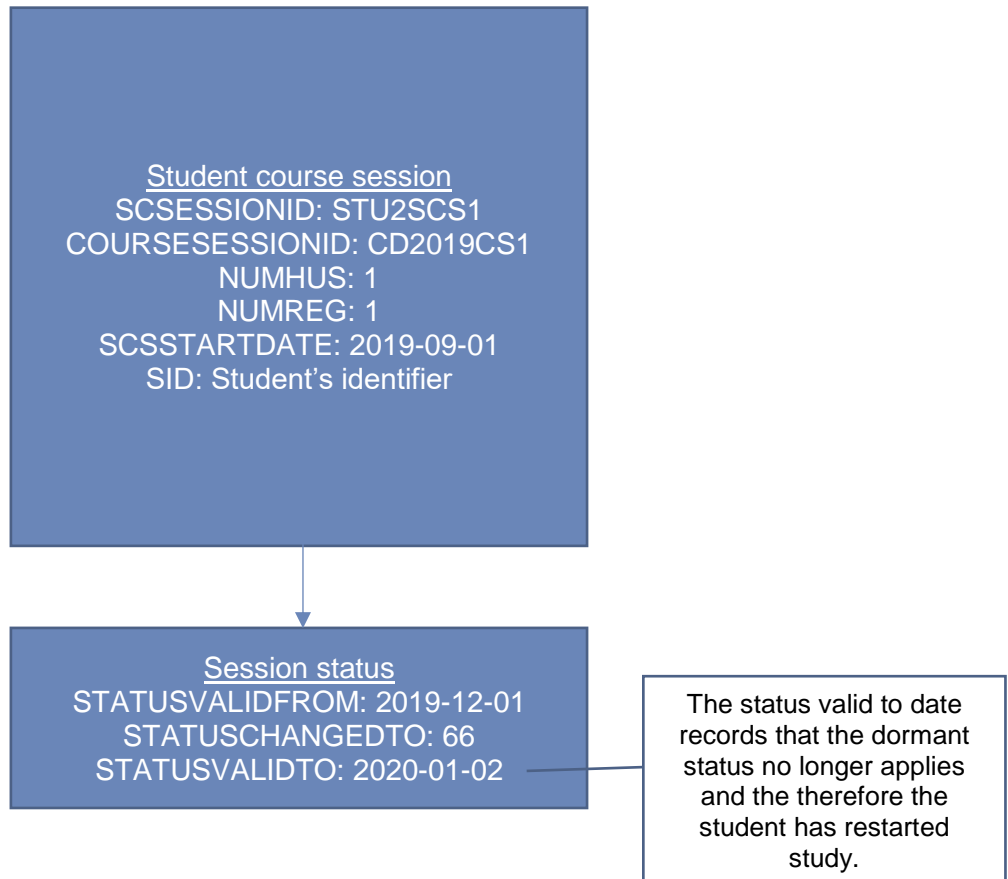

Returning the session status rather than ending the Student course session allows the Student course session to be recorded as active again if the student resumes study before the associated Course session ends.

Student 2: Student goes dormant and restarts study within the same Course session

The student restarts study before the end of the associated Course session.

The Session status entity is returned again, this time with an end date to indicate that the dormant status no longer applies.

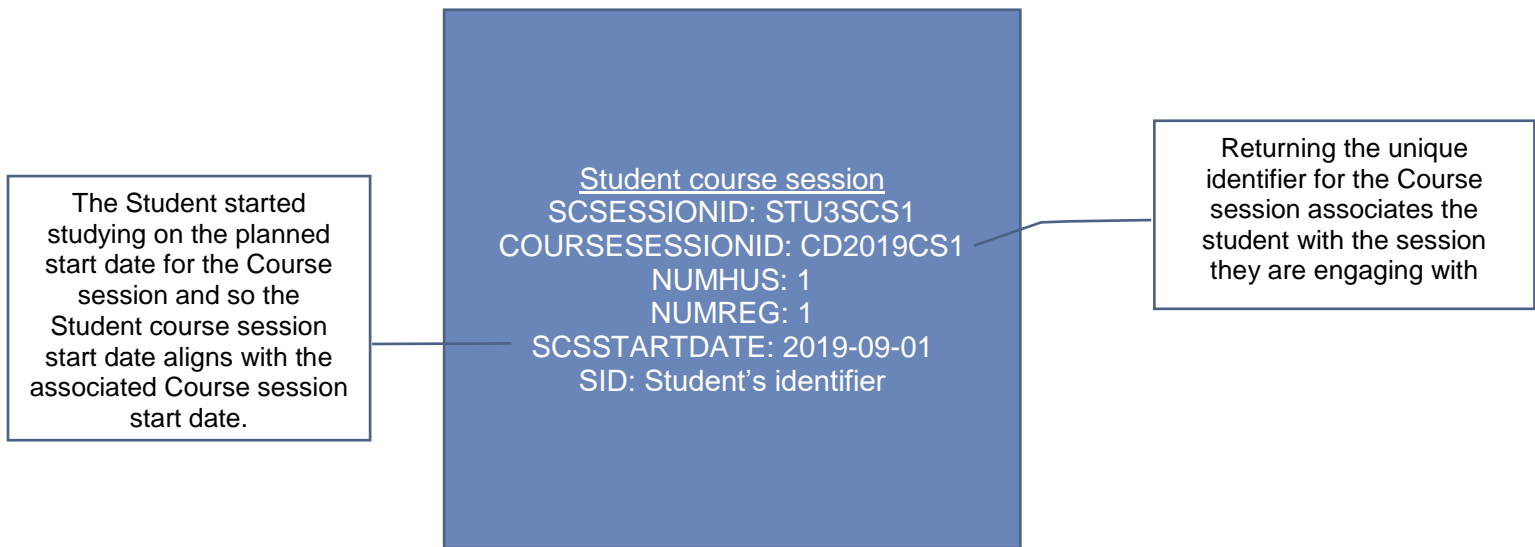

If the student had not returned to study before the end of the associated Course session, the Student course session would be updated with a RSNSCSEND of 02 'Interrupted' and a SCSENDDATE aligning with the end of the Course session (2020-08-31).

Student 3: Student goes dormant at the end of a Course session

Student 3 begins studying on Course delivery 1.

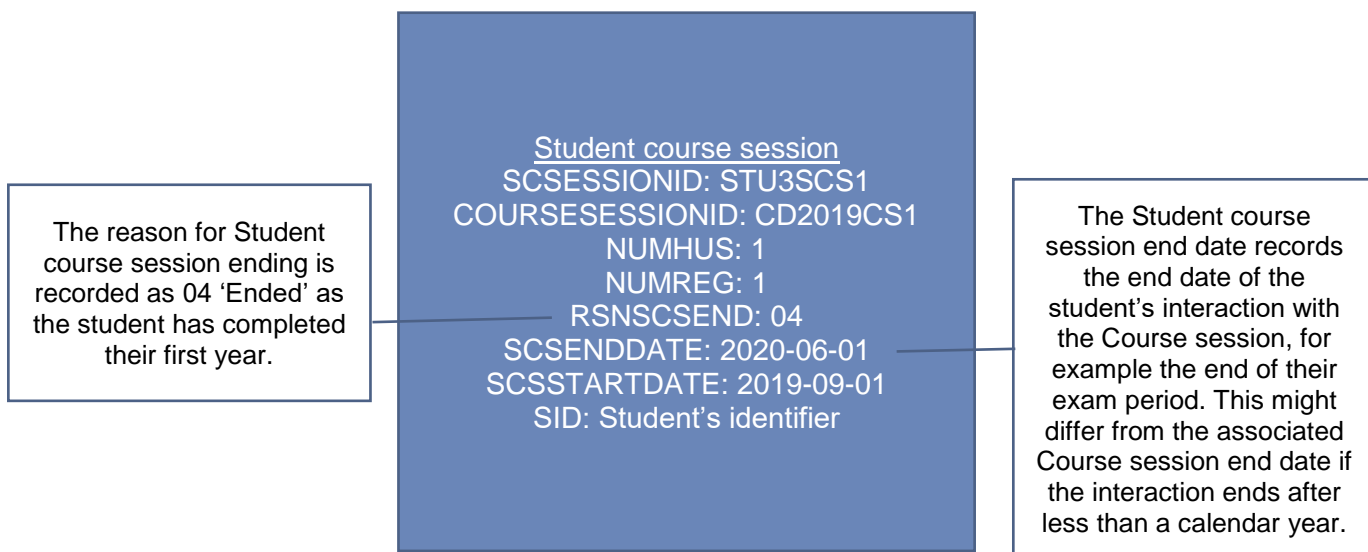

When the student began studying, they would have been associated with the first Course session of Course delivery 1 with the return of a Student course session.

Student 3: Student goes dormant at the end of a Course session

The student completes their first year.

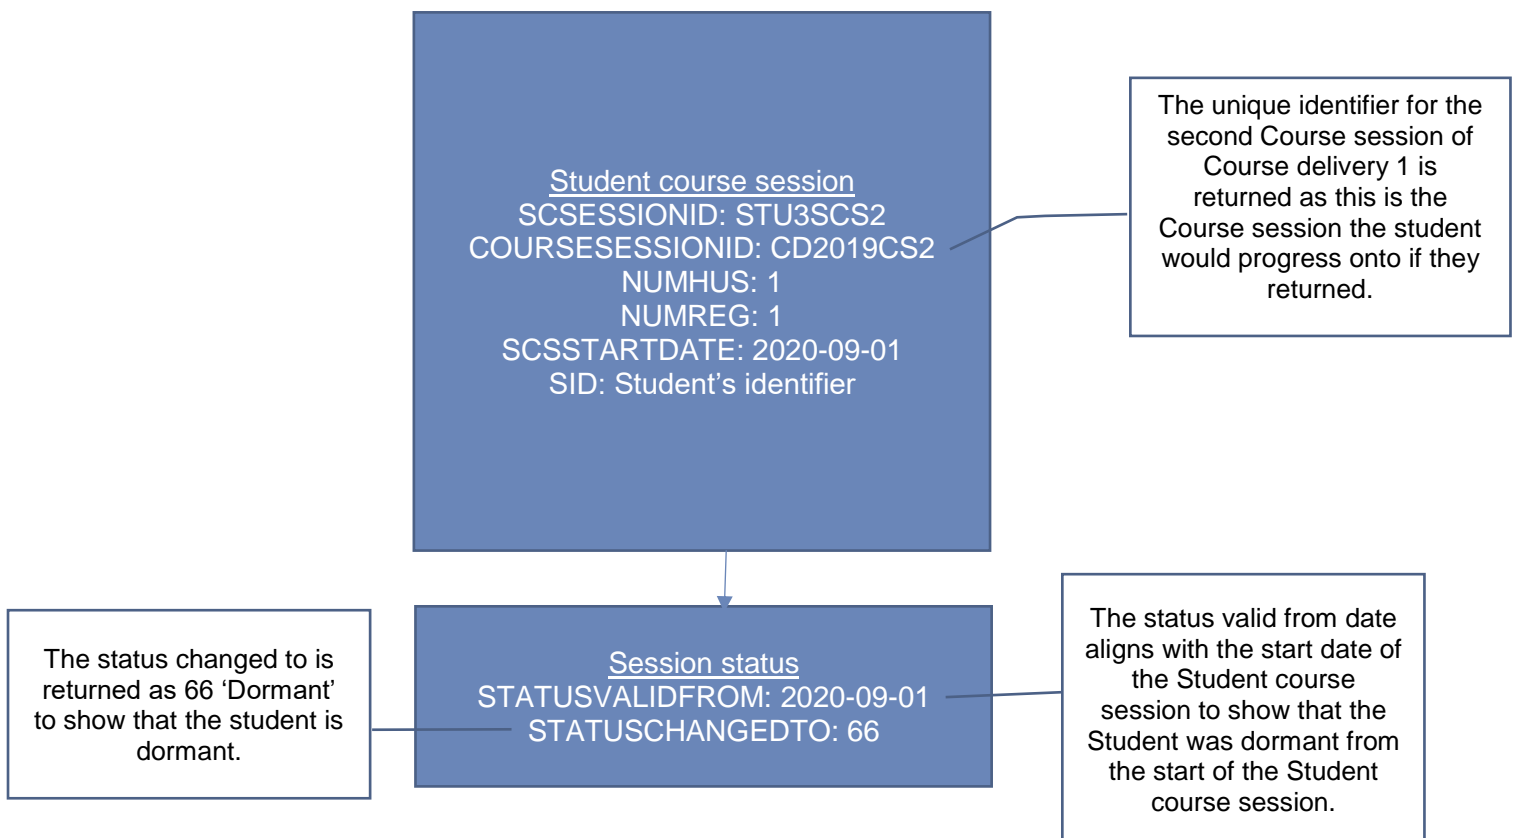

The Student course session is ended with a reason for Student course session end and an end date.

Student 3: Student goes dormant at the end of a Course session

The student does not return as expected for their second year. The provider must positively declare that the student has gone dormant.

Another Student course session must therefore be returned with a Session status update indicating the student's dormant status.

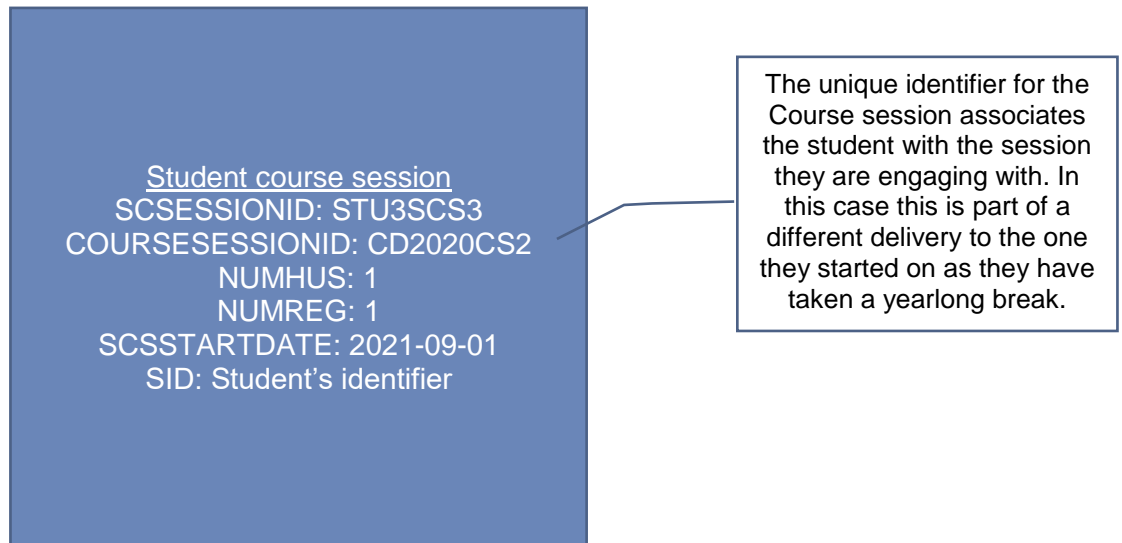

Returning another Student course session with the Session status indicating dormancy confirms that the student is not actively studying.

If the student was still on an agreed break in learning at the end of the Student course session, a RSNSENSEND of 02 'Interrupted' would be returned and the student would not need to be returned again until they restart study, or they will no longer be returning to study.

Student 3: Student goes dormant at the end of a Course session

Student 3 restarts study following a year long break. They are therefore progressing onto the second year of their programme but are not on the same Course delivery.

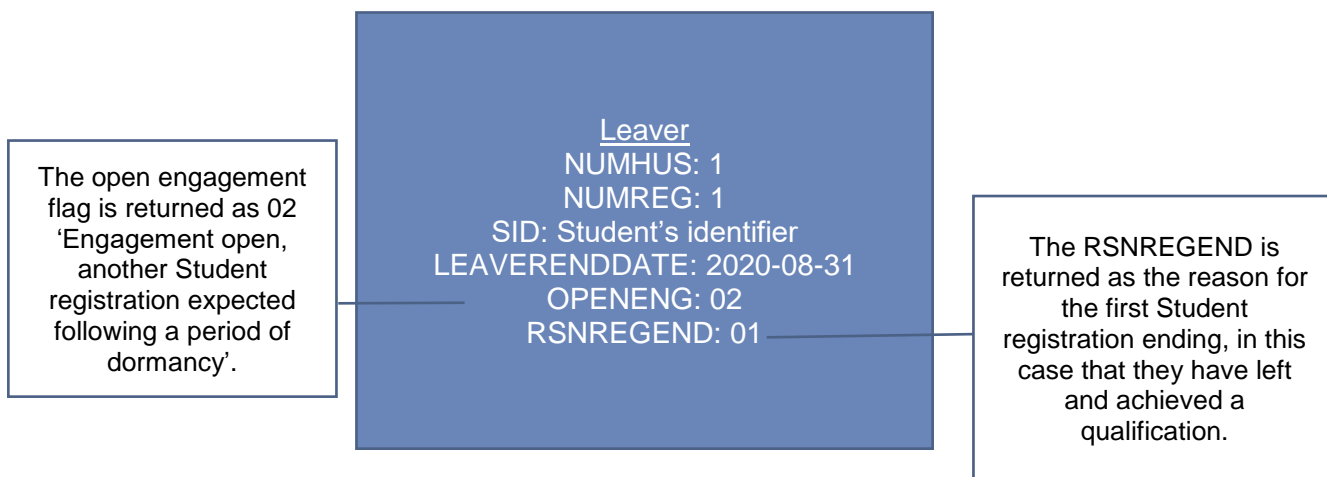

They would be associated with the second Course session of Course delivery 2 as this would reflect that they are on year 2 of their programme (YEARPRG = 2) whilst correctly reflecting the timings of their study, including their expected end date.

Student 5: Student goes dormant between Student registrations

Student 5 has multiple Student registrations as part of their Engagement. Following completing the first Student registration, they agree to take a break in learning before beginning the second Student registration.

A Leaver entity would be returned for the first Student registration indicating that it has ended, and more activity is expected.

The return of the OPENENG field indicates that, whilst this Student registration has ended, another is expected as part of the same Engagement and so the Engagement is still open. The return of 02 in this field indicates that subsequent Student registrations are expected following a period of dormancy.

The return of 02 in this field therefore means the student does not have to be returned again until they restart study, or they will no longer be returning to study.

If the value returned in OPENENG subsequently changes (for example the student later drops out of their Engagement and will not be returning), this value must be updated.
